

# How to exclude crond from audit logs

🟢 **SOLUTION VERIFIED** - Updated November 17 2015 at 1:57 PM - English ▾()

## Environment

- Red Hat Enterprise Linux 5
- Red Hat Enterprise Linux 6
- Red Hat Enterprise Linux 7

## Issue

- How can we disable all the extra PAM-related crond messages from filling up /var/log/audit/audit.log?
- Auditd logs show at least 6 events audit.log every time cron runs a job. In my case that's every 5 minutes cause that's what I have set sar to.

```
type=USER_ACCT msg=audit(1336941301.016:10008): user pid=27266 uid=0
aid=4294967295 msg='PAM: accounting acct="root" : exe="/usr/sbin/crond"
(hostname=?, addr=?, terminal=cron res=success)'
type=CRED_ACQ msg=audit(1336941301.016:10009): user pid=27266 uid=0
aid=4294967295 msg='PAM: setcred acct="root" : exe="/usr/sbin/crond"
(hostname=?, addr=?, terminal=cron res=success)'
type=LOGIN msg=audit(1336941301.016:10010): login pid=27266 uid=0 old
aid=4294967295 new aid=0 old ses=4294967295 new ses=1542
type=USER_START msg=audit(1336941301.046:10011): user pid=27266 uid=0 aid=0
msg='PAM: session open acct="root" : exe="/usr/sbin/crond" (hostname=?, addr=?,
terminal=cron res=success)'
type=CRED_DISP msg=audit(1336941301.076:10012): user pid=27266 uid=0 aid=0
msg='PAM: setcred acct="root" : exe="/usr/sbin/crond" (hostname=?, addr=?,
terminal=cron res=success)'
type=USER_END msg=audit(1336941301.076:10013): user pid=27266 uid=0 aid=0
msg='PAM: session close acct="root" : exe="/usr/sbin/crond" (hostname=?, addr=?,
terminal=cron res=success)'
```

- Add an audit rule like the following to minimize audit events triggered by crond executing cron jobs

```
-A never,user -F subj_type=crond_t
```

- Notes:
  - This does not work in RHEL 5 (there are no other options there)
  - This does not work if SELinux is disabled (as it relies on filtering by the SELinux context type of the crond process)
  - If unable to add the rule, crond-triggered audit events can be minimized by combining cron jobs, e.g., with the following 3 jobs:

```
*/4 * * * * somecommand
*/4 * * * * another-command
*/4 * * * * some-other-command
```

In RHEL 6, that's going to generate 18 audit events every 4 minutes

Instead, they could be combined into a single line that would only generate 6 events every 4 minutes, e.g.:

```
*/4 * * * * somecommand; another-command; some-other-command
```
